

Exp. No. 4

Design a lexical Analyzer to validate operators to recognize the operators +, -, *, / using regular arithmetic operators using C

main.c Run ▶

```
1  #include <stdio.h>
2  int main()
3  {
4      char op;
5      printf("Enter operator: ");
6      scanf(" %c", &op);
7      switch(op)
8      {
9          case '+':
10             printf("Operator: + (Addition)\n");
11             break;
12          case '-':
13             printf("Operator: - (Subtraction)\n");
14             break;
15          case '*':
16             printf("Operator: * (Multiplication)\n");
17             break;
18          case '/':
19             printf("Operator: / (Division)\n");
20             break;
21          default:
22             printf("Invalid Operator\n");
23      }
24      return 0;
25 }
```

Output

```
Enter operator: (+, -, *, /): /
Invalid Operator
```
